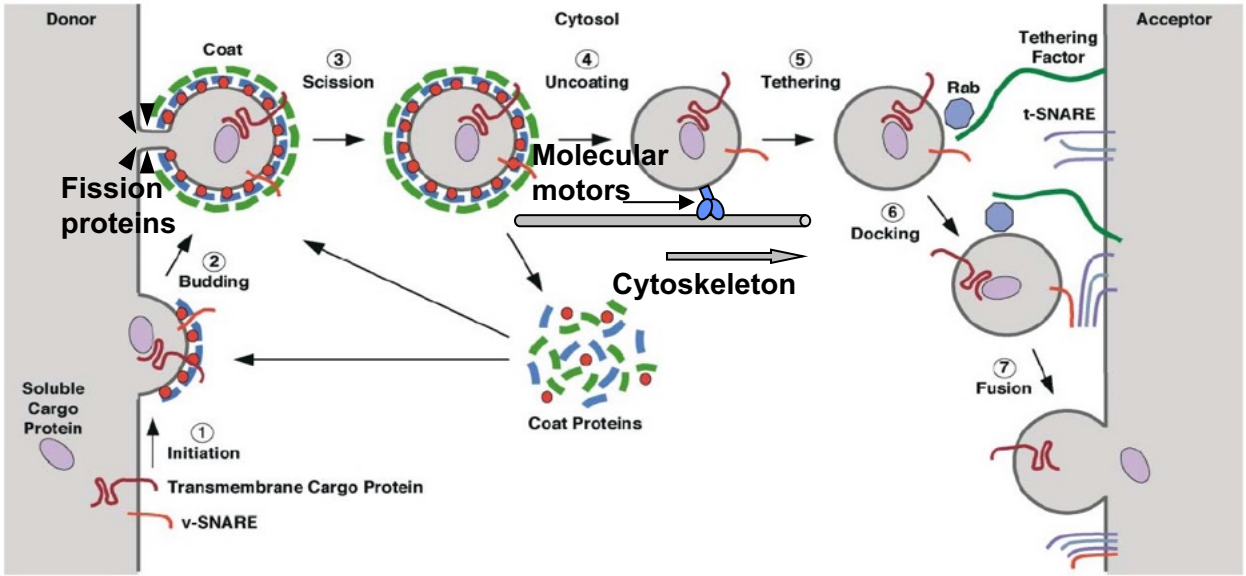
Red: Microtubules
Green: Golgi (VSV-G)
Overlap: yellow

Formation of small vesicles, tubes:
requires to *strongly deform* membranes

Different Steps of "Vesicular" Transport



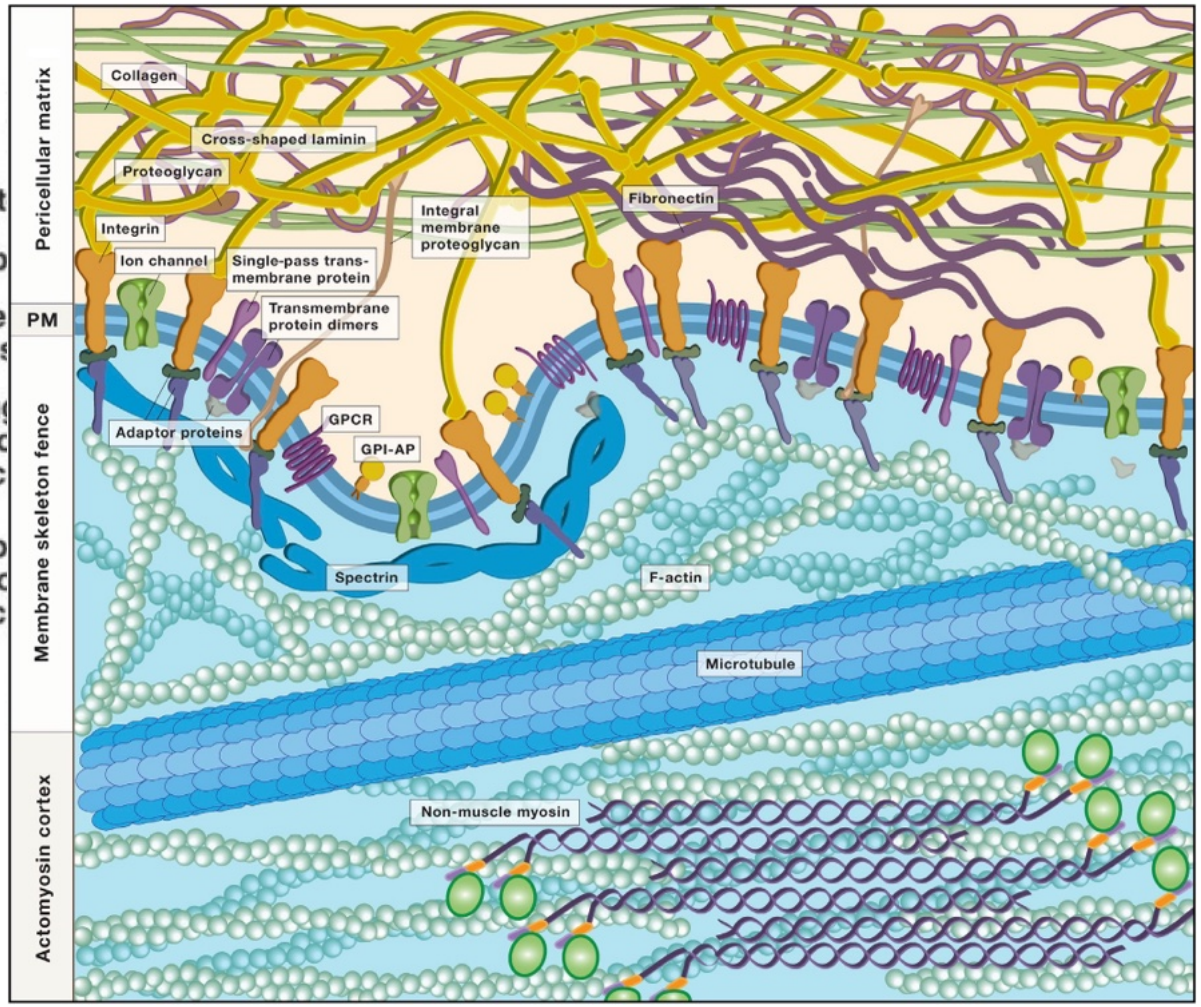
Bonifaccio and Glick
Cell (2004)

1) Sorting (Proteins and lipids) + Budding
2) Fission
3) Transport (Microtubules)
4) Targeting-Docking
5) Fusion

Cell Envelop: the Plasma Membrane

Outside

Inside



Lipid Membrane

~5 nm

K. Jacobson, ….B. Lagerholm, *Cell* (2019)

Lipid membrane reinforced by the actin cortex

Membrane Basis: Lipid Bilayer

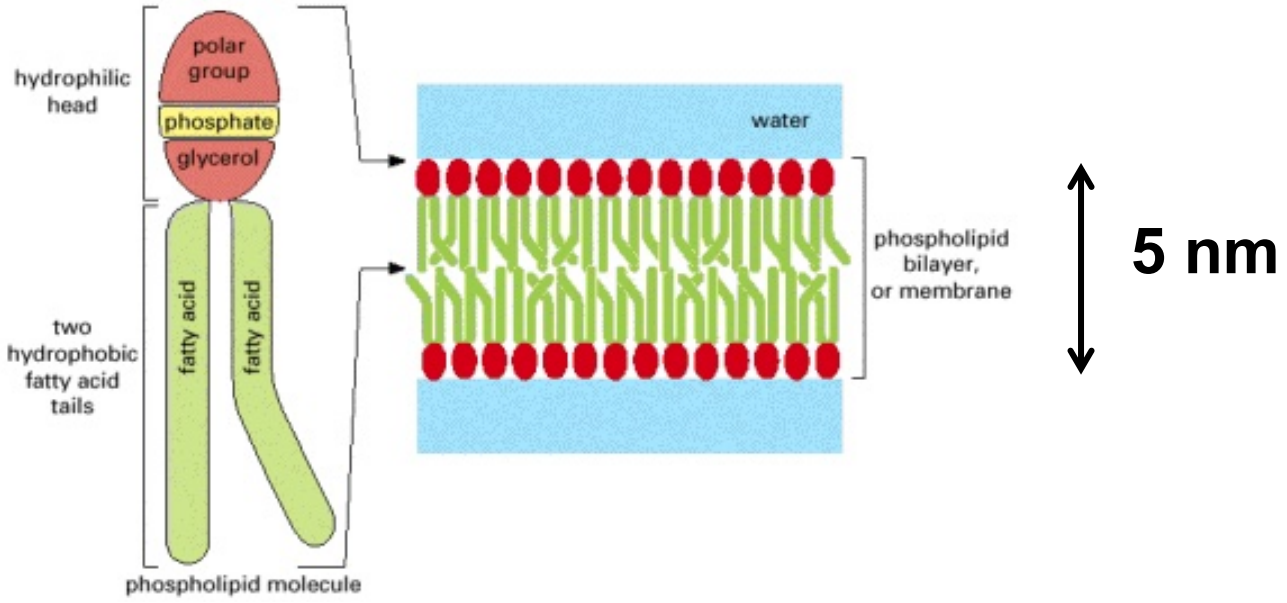
Self-assembly of *amphiphilic* molecules

Hydrophilic head group

Hydrophobic chains

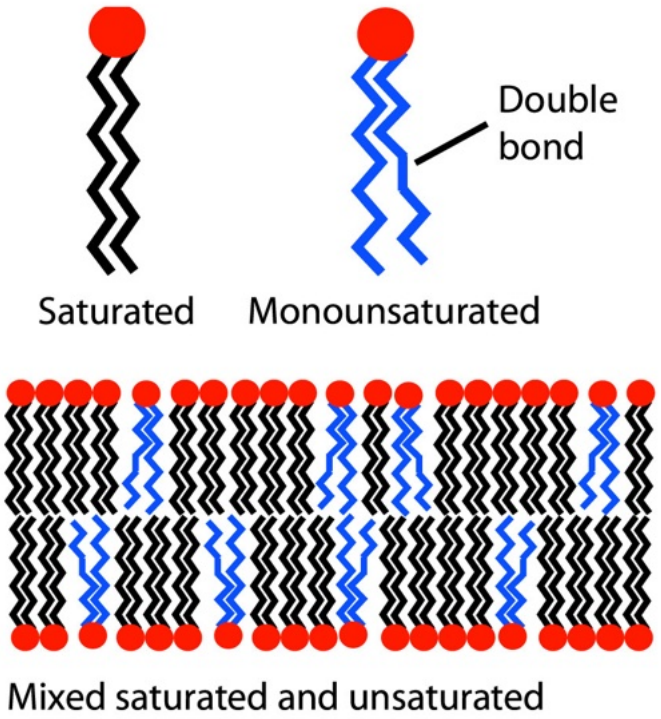
.....

Lipid bilayer



Membrane – Lipid Bilayer

Chains: fully saturated
or with unsaturations

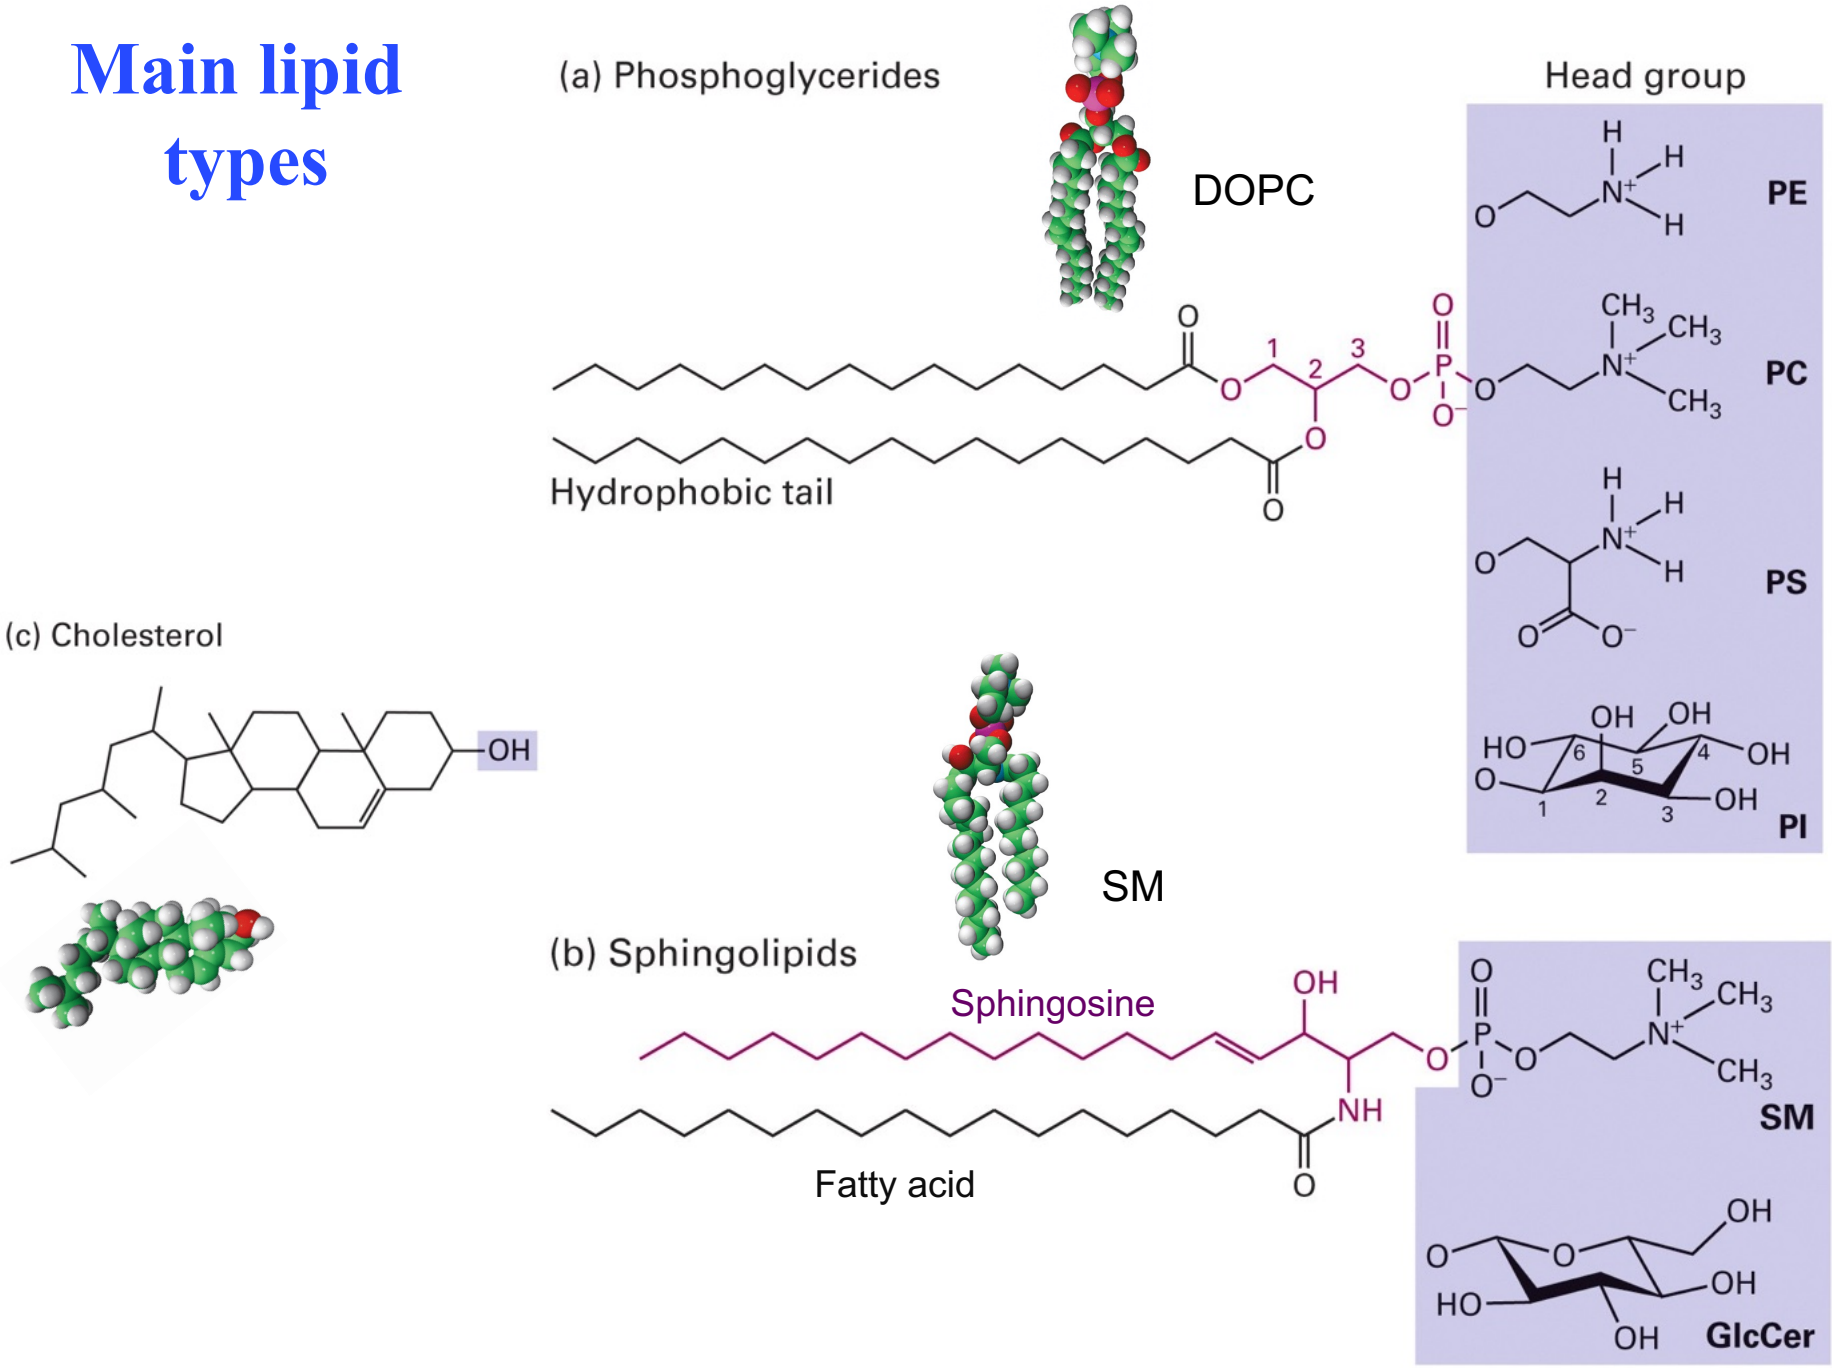


Commonly found in lipid membranes:

Saturated chains: C12 to C20

Unsaturated chains: C16:1, C18:1, C18:2, C18:3, C20:2, polyunsat. C22, C24 etc…

Main lipid types



Plasma Membrane: Heterogenous 2D-Fluid

Lipid bilayer

Lipids, high density of membrane proteins (inclusions, bound)

Inhomogeneities (lipid rafts, protein clusters …)

Confinement due to cortical actin filaments

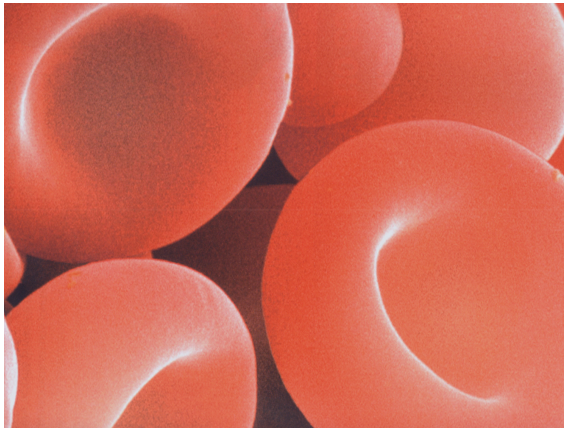
Lipid Membrane Mechanics

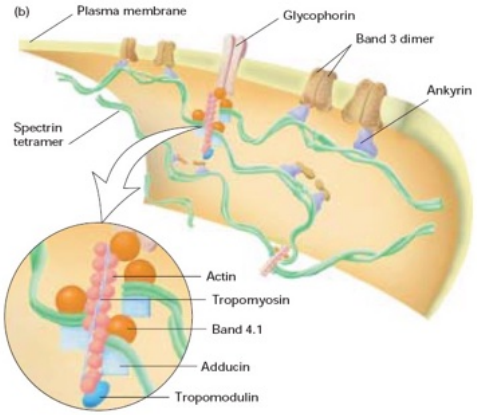
Objective: *modeling cell membranes*

W. Helfrich, E. Sackmann, E. Evans (>1973) etc…

Model membrane systems required to test theoretical models

1st model system available =Red Blood Cells





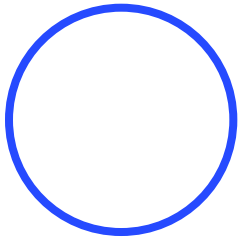
Still too complex…..

In the 80', first developments of giant liposomes with a single lipid type

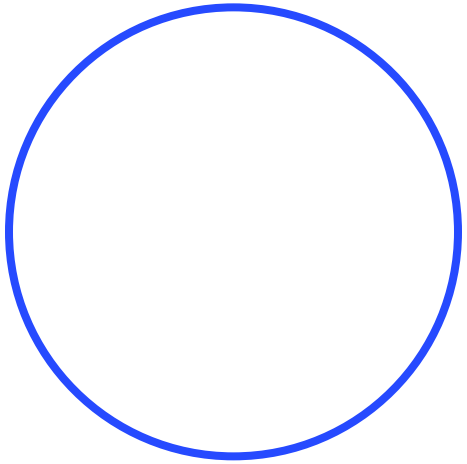
Model Membranes

Liposomes

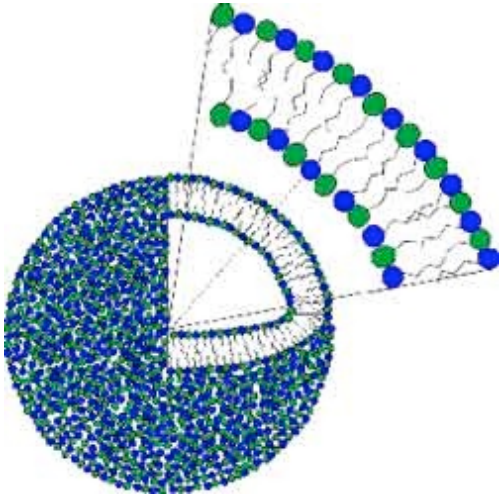
Small vesicles
(< 100 nm)



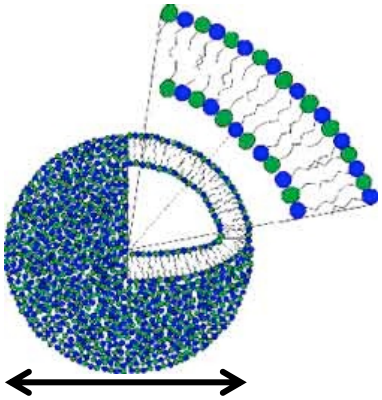
Large vesicles
(100 nm – 1 μm)



Giant vesicles
> a few μm - 100 μm)



Some Technics to Study GUVs



≈ 10 µm and above

Measurements on a Single GUVs

Same methods as in cell biology

Perfect with *optical microscopy*

But a bilayer:

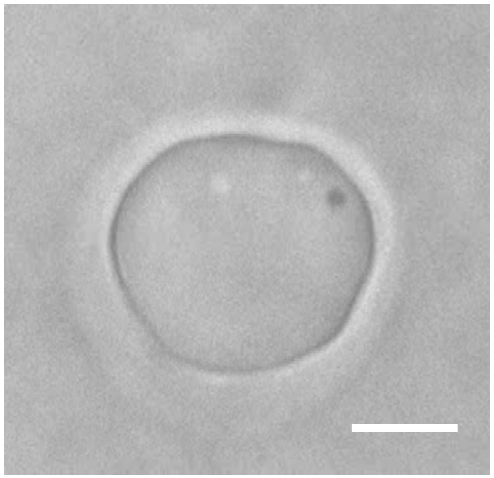
n=1.38-1.42 , e= 5nm, in water (n=1.33)….

➡ Increase the contrast

- Different media inside and outside the GUV (sugar, buffers + balance osmotic pressure)

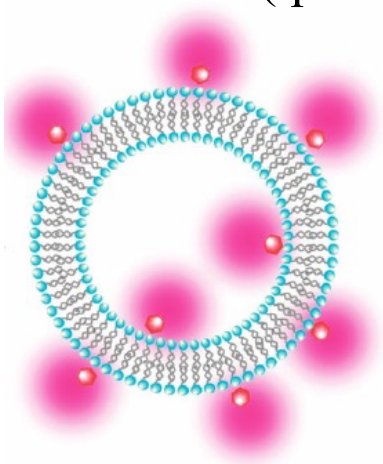
- Add a small fraction of fluorescent molecules (a few 0.1 % fluorescent lipids)

Use CONFOCAL microscopy (quantitative measurements)

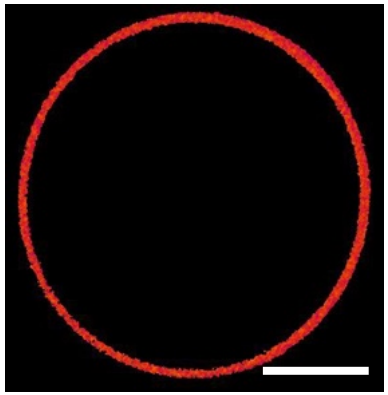


10 µm

Phase contrast microscopy



From: H. Robson Marsden et al, *Chem. Soc. Rev.*, (2011)

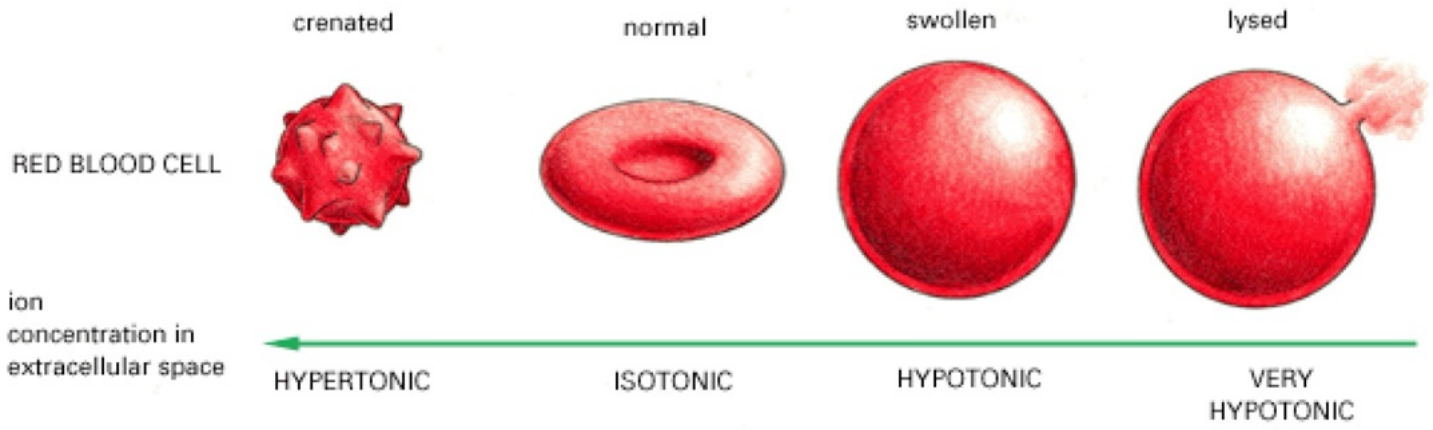


10 µm

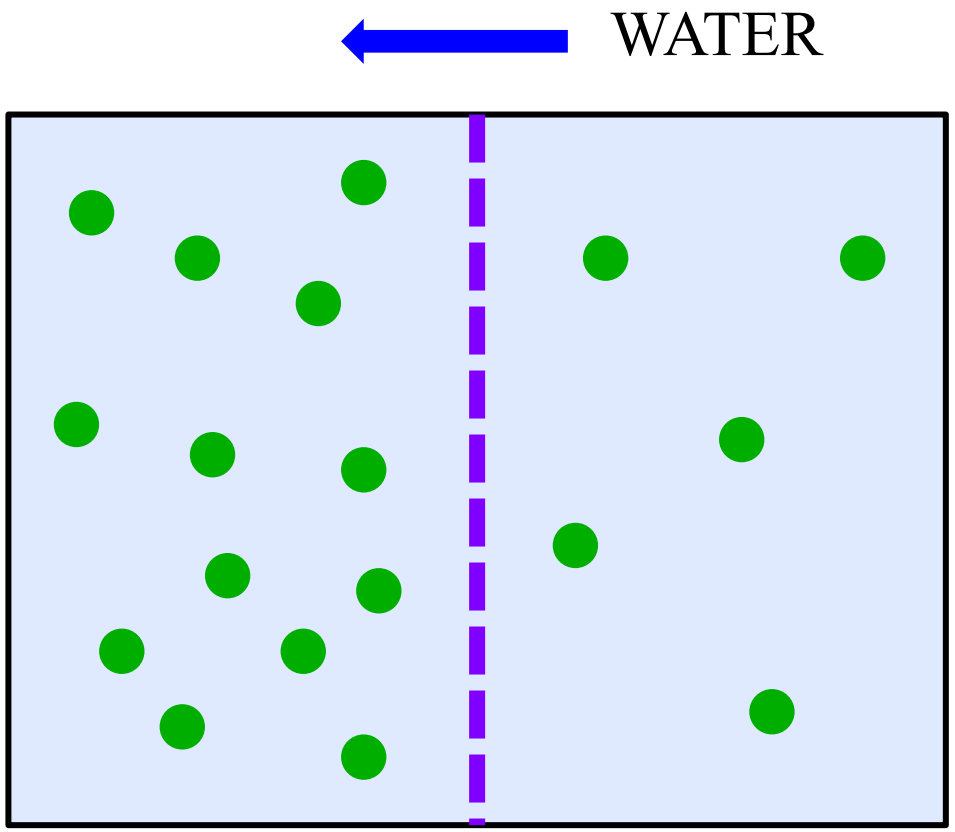
Membrane Tension

Cell Volume Changes
Due to Osmotic Pressure Differences

Red Blood Cells



Membrane Semi-Permeability and Water Flow



Permeability to water
But not to solute

Δc: molar concentration difference between compartments

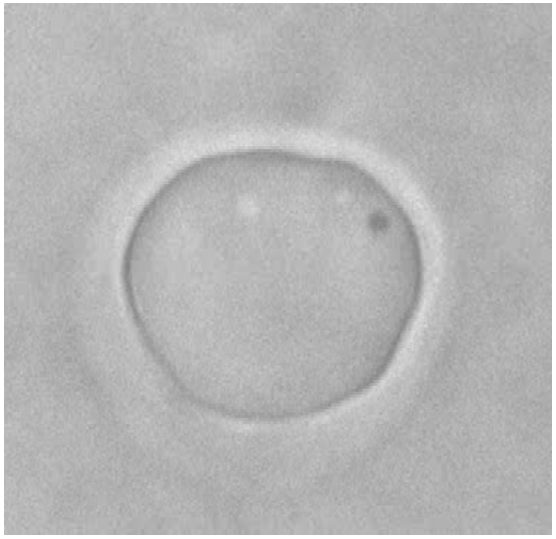
● Glucose or sucrose
(do not cross the membrane)

Osmotic pressure difference

$$\Delta\Pi = \Delta cRT \qquad (R = 8.31\ J/K.mol)$$

Water flows to equilibrate the differences

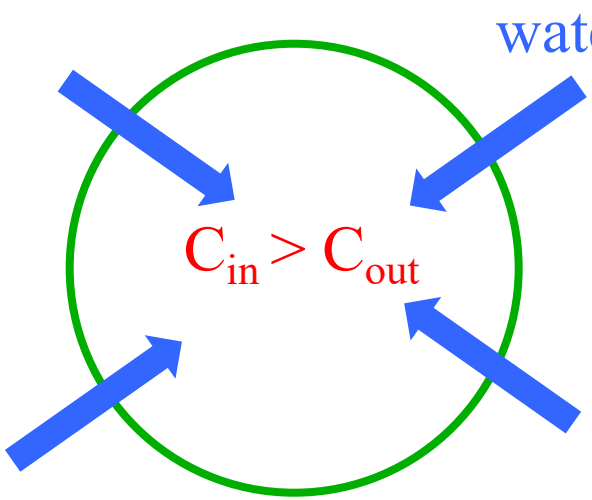
GUV Membrane can be Stretched



Changing tension by changing the osmotic pressure

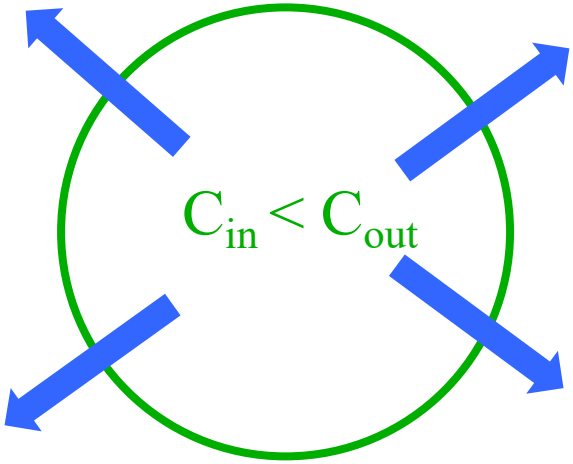
GUV Volume Changes Due to Osmotic Pressure Differences

Hypotonic

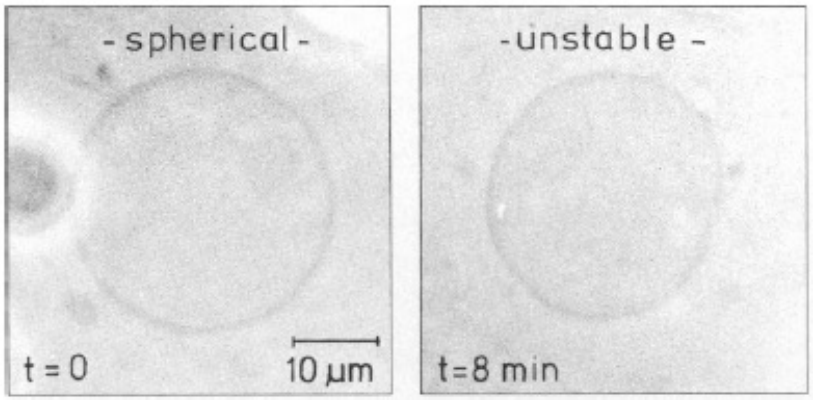


Swelling
Bursting…

Hypertonic

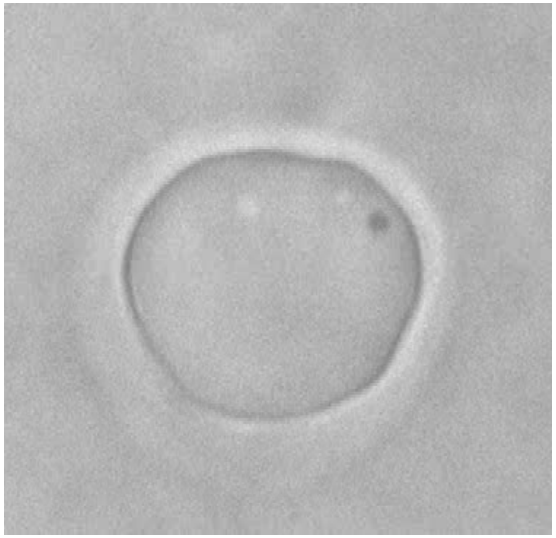


Deflating

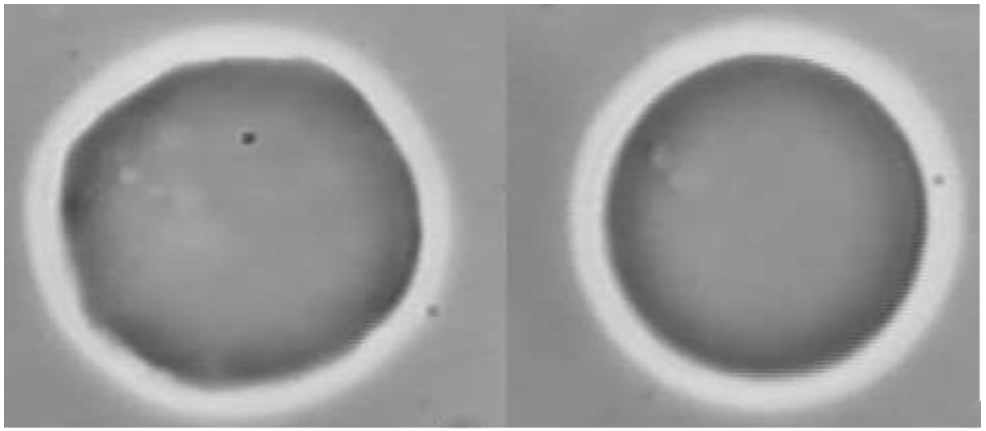


E. Boroske et al, *Biophys. J.* **34**, 95 (1981)

GUV Membrane can be Stretched



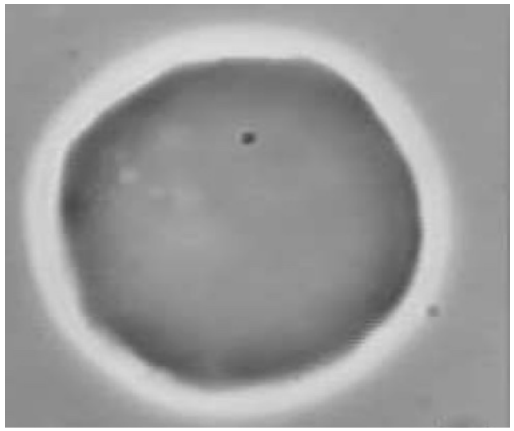
Hypertonic Hypotonic

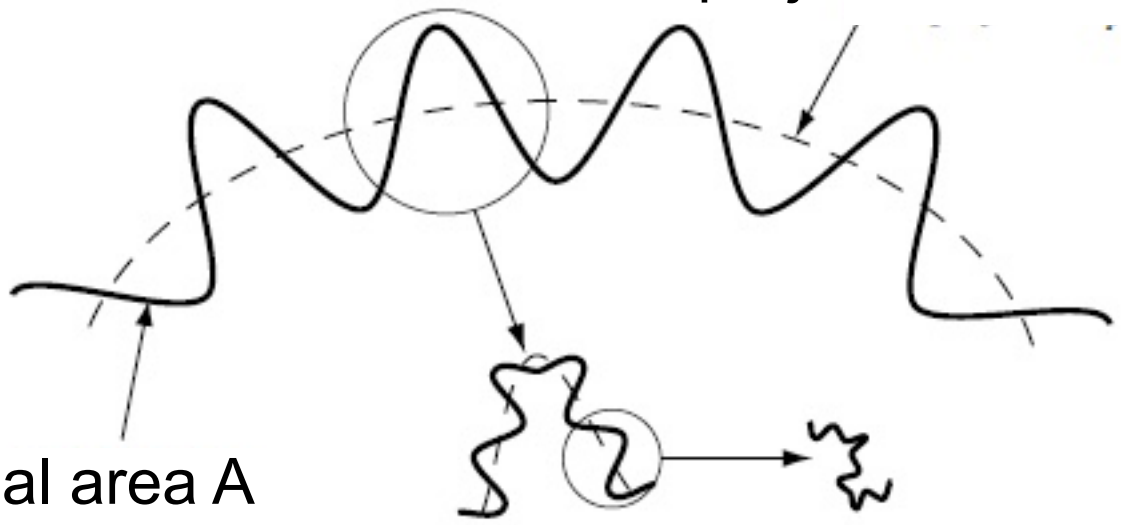


Low σ (10^{-8} - 10^{-6} N/m)

High σ (10^{-6} - 10^{-3} N/m)

Changing tension by changing the osmotic pressure



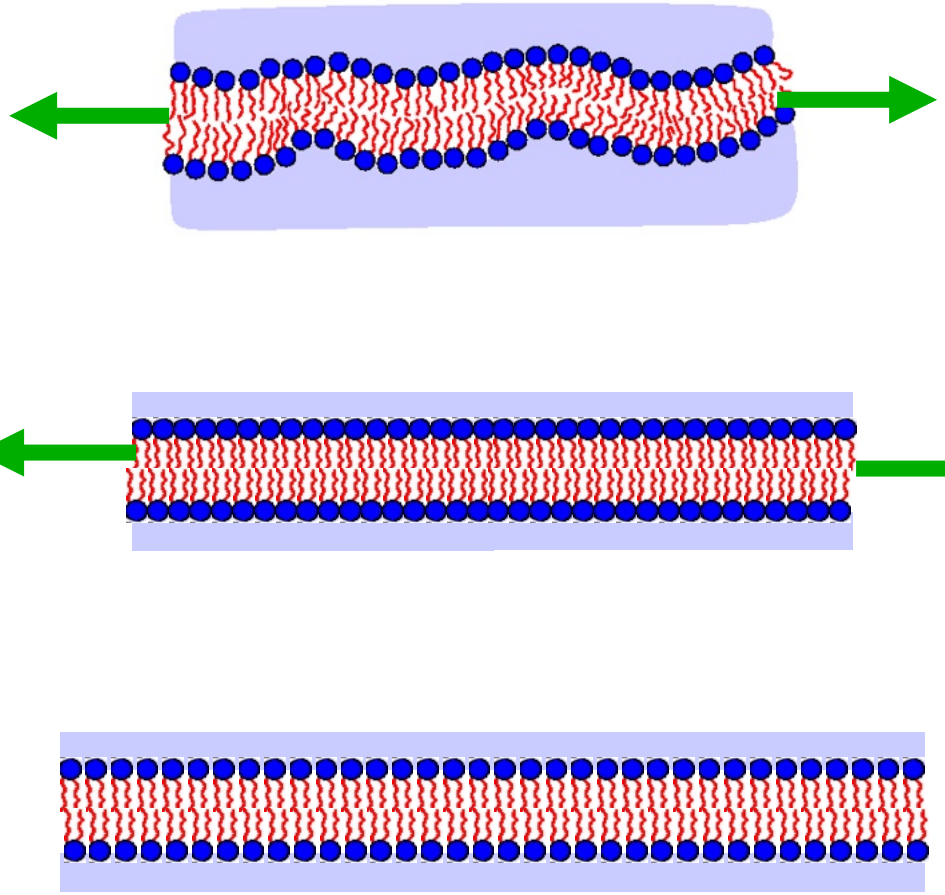


Excess area: $\Delta A = A - A_p$ Surface stored in fluctuations

Relative excess area: $\alpha = \frac{\Delta A}{A_p}$

Lipid Membrane Elasticity

Free-energy for membrane stretching H_s:



$$\sigma = \frac{\partial H_s}{\partial A}$$

A: membrane area

σ: membrane tension

(in Joules/m^2 or N/m)

Elastic regime

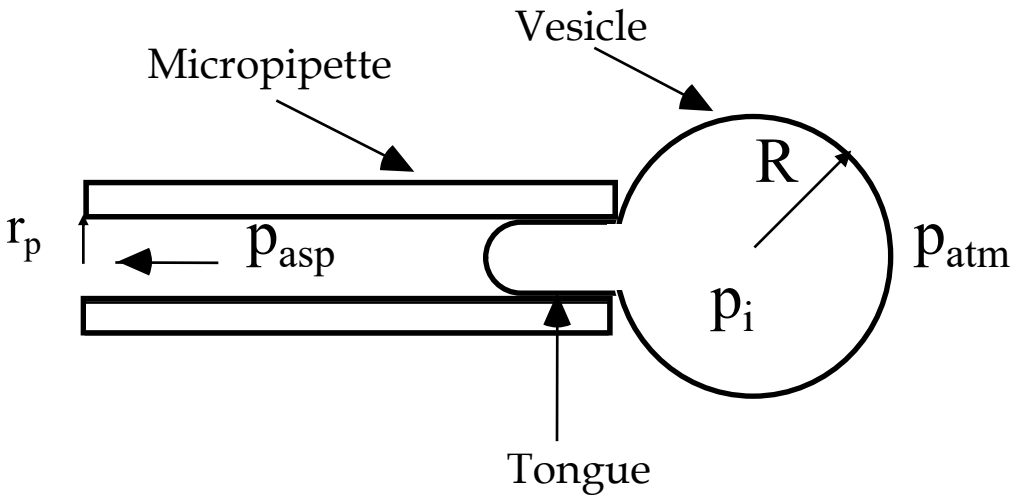
$$\sigma = K_a \frac{\Delta A}{A}$$

Cf. Hook's law

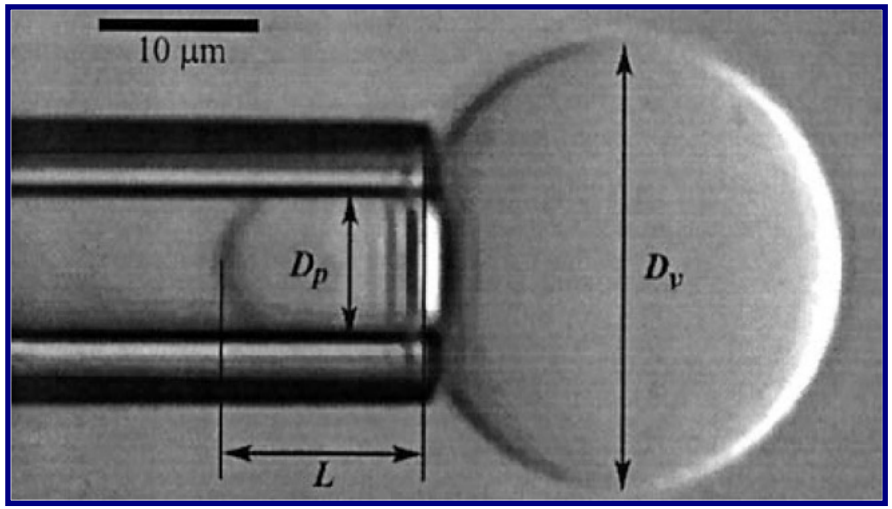
K_a: stretching modulus

Controlled Membrane Tension: Micropipette Aspiration

Evan Evans
UBC, Vancouver

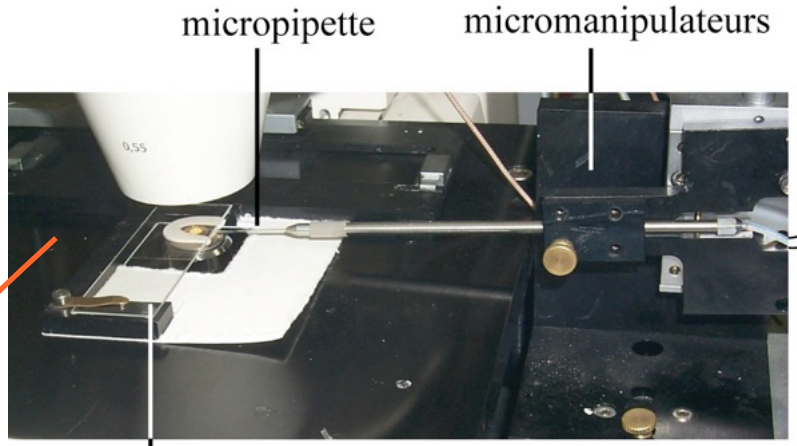


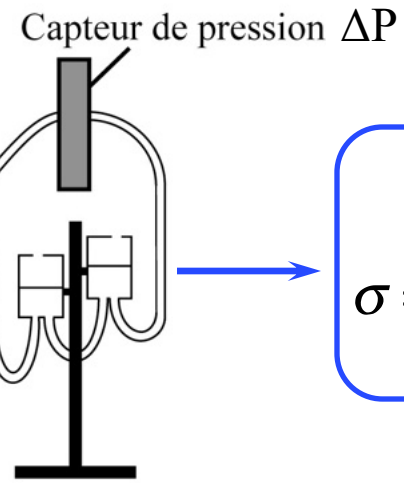
(Kwok et Evans, 1981)



Giant Unilamellar Vesicle (GUV)

Micropipette Aspiration (Kwok et Evans, 1981)





DIC

Tension:

$$\sigma = \frac{D_p}{4(1 - D_p / D_v)} \Delta P$$

ΔP

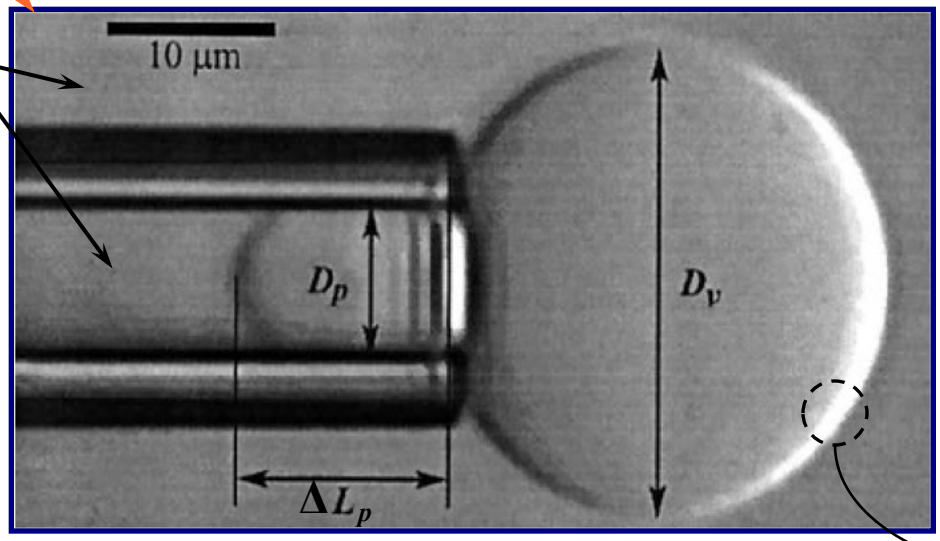


Image analysis

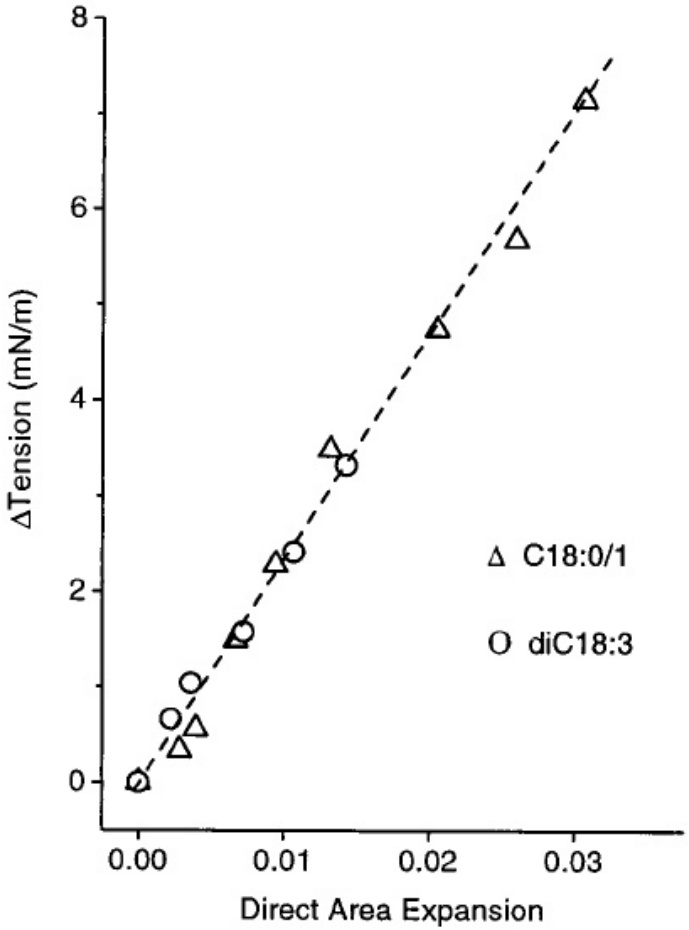
Excess area:

$$\Delta\alpha = \frac{(D_p/D_v)^2 - (D_p/D_v)^3}{D_p} L_p$$

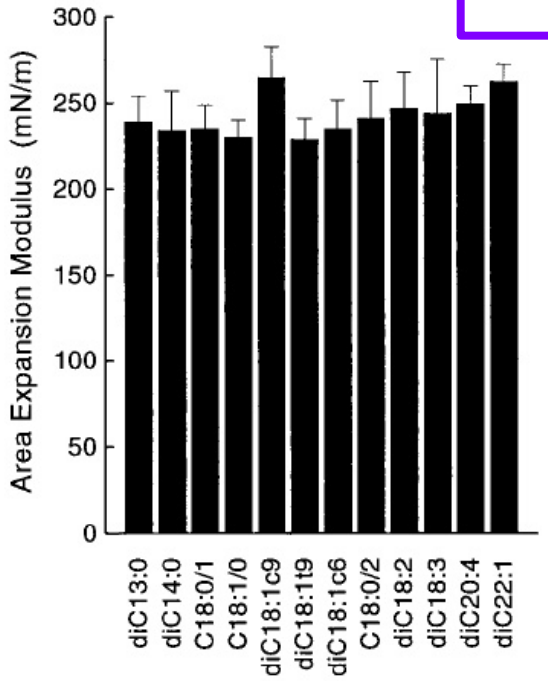


$$\sigma - \sigma_0 = K_a \Delta\alpha$$

W. Rawicz …E. Evans *Biophys. J.* **79**, 328-339 (2000)

Stretching moduli

$$\sigma = K_a \frac{\Delta A}{A}$$



W. Rawicz …E. Evans *Biophys. J.* **79**, 328-339 (2000)

System	$K_A \pm$ SD (mN/m) 32–35°C
One component	
DOPC	—
SOPC	290 ± 17

1:1:2 Ternary	
SOPC/SM/CHOL	1377 ± 172

W. Rawicz .. E. Evans *BJ* **94**, 4725-4736 (2008)

K_a:

PC lipids: *insensitive* to chain length, unsaturations

Larger with Sphingolipids

Increases with cholesterol

Lipid membranes:

Hard to stretch

(≈ 5 times harder/polyethylene)

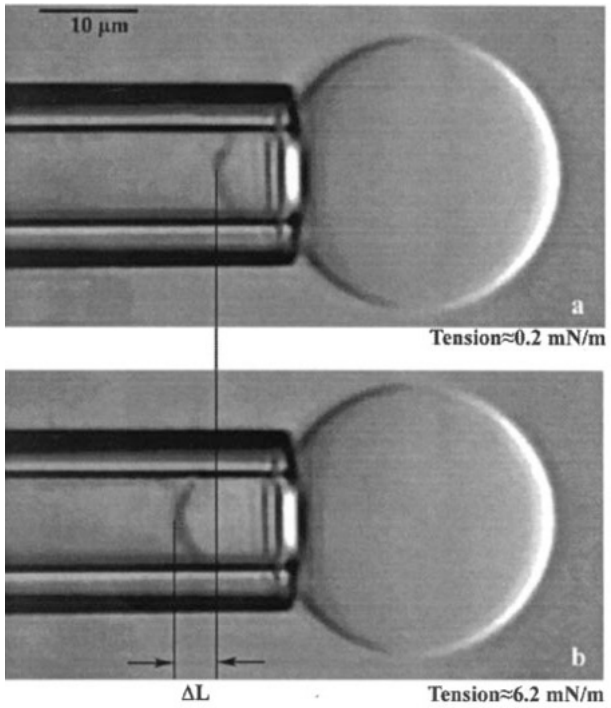
Lipid Membranes: Fragile upon Stretching

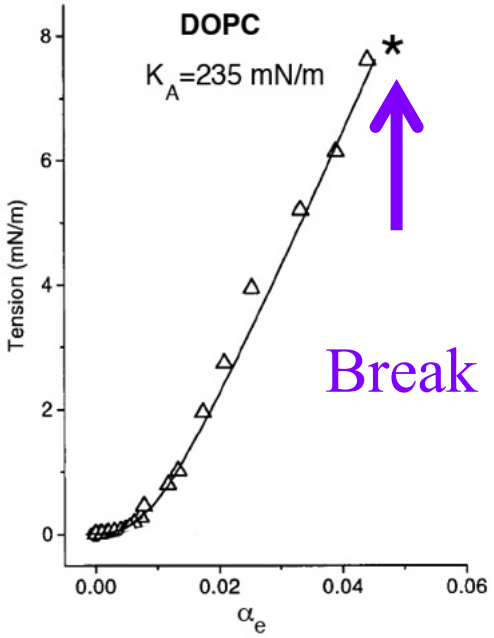
Strain limited to ≈ 5%

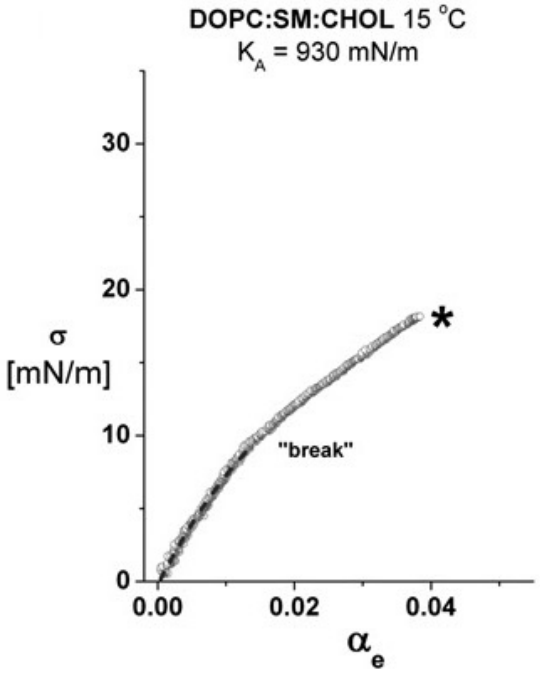
E. Evans

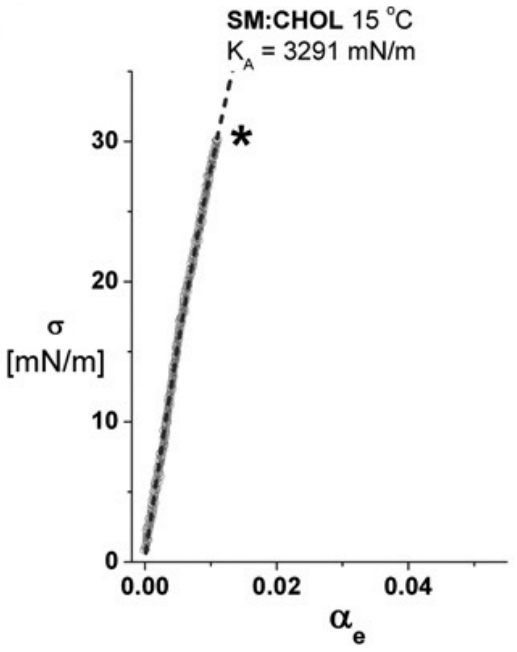
W. Rawicz, et al *Biophys. J.* **79**, 328 (2000)

W. Rawicz et al *Biophys. J.* **94**, 4725 (2008)

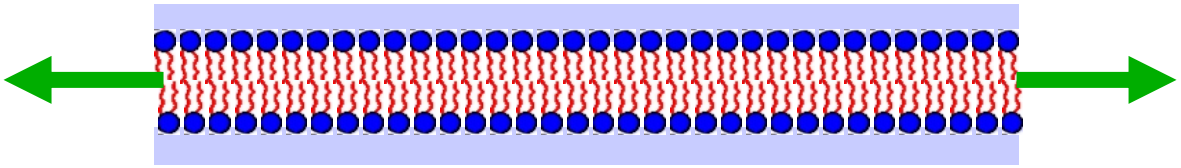




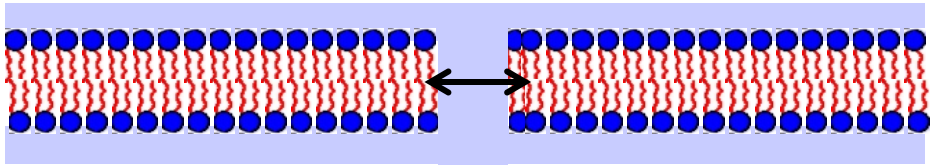




High Tension: Membrane Lysis

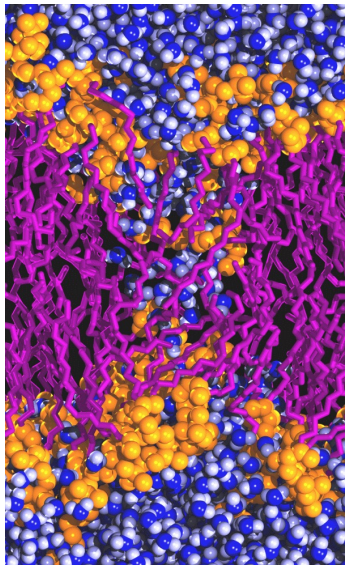


HOLE

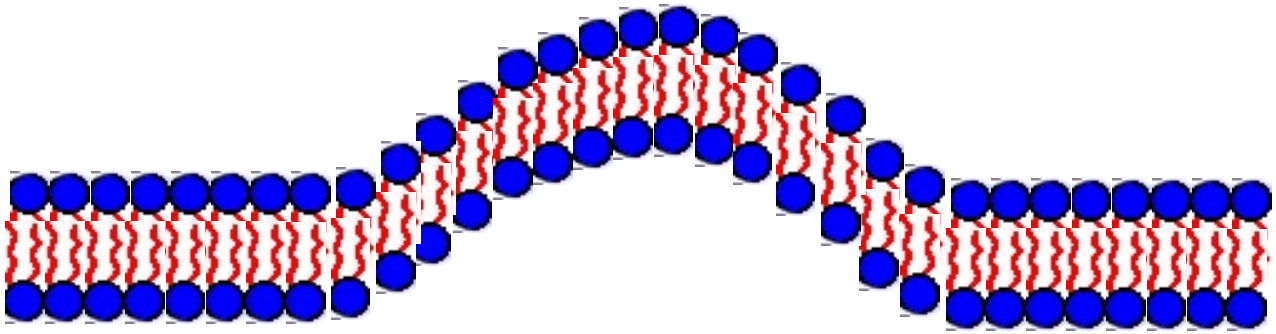


Max Strain $\Delta\alpha \approx 5\%$

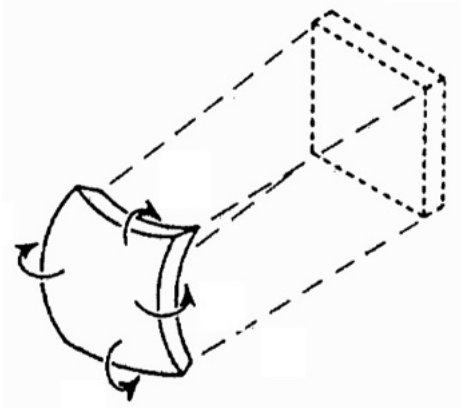
Numerical simulations



Lipid Membranes: Easily Bent



Allows for intracellular trafficking, endocytosis, exocytosis



Bending Energy of Fluid Membranes

W. Helfrich
P. Canham
E. Evans (≈1970)

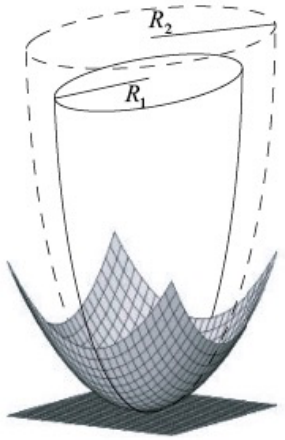
Energy/unit area:

$$f_{bending} = \frac{1}{2}\kappa C^2$$

W. Helfrich, *Zur Naturforschung* **28c**, 693 (1973)
"Elastic properties of lipid bilayers :
theory and possible experiments"

C: Mean curvature

$$C = C_1 + C_2 = \frac{1}{R_1} + \frac{1}{R_2}$$



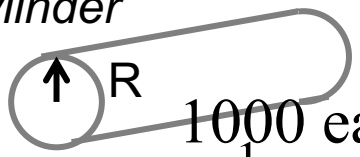
κ : **bending modulus**

from a few k_BT to ≈ 100 k_BT $(k_BT = 4.10^{-21} J)$

depends on composition

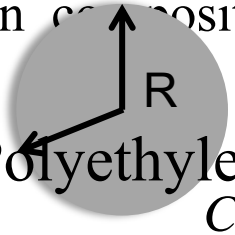
1000 easier than Polyethylene

cylinder



$$C = \frac{1}{R}$$

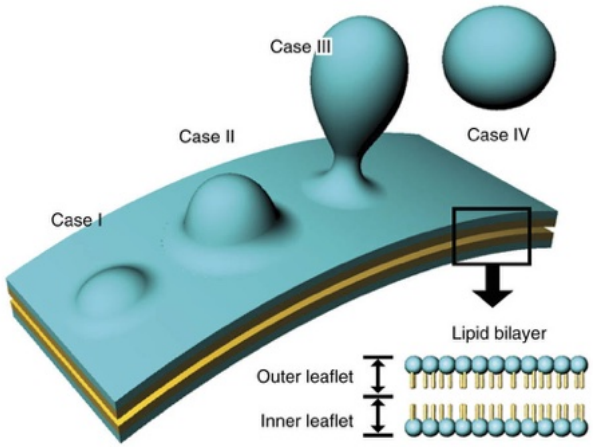
sphere



$$C = \frac{1}{R} + \frac{1}{R} = \frac{2}{R}$$

$$f_{bending} = \frac{1}{2}\kappa C^2$$

Energy to form a spherical vesicle from a flat membrane:



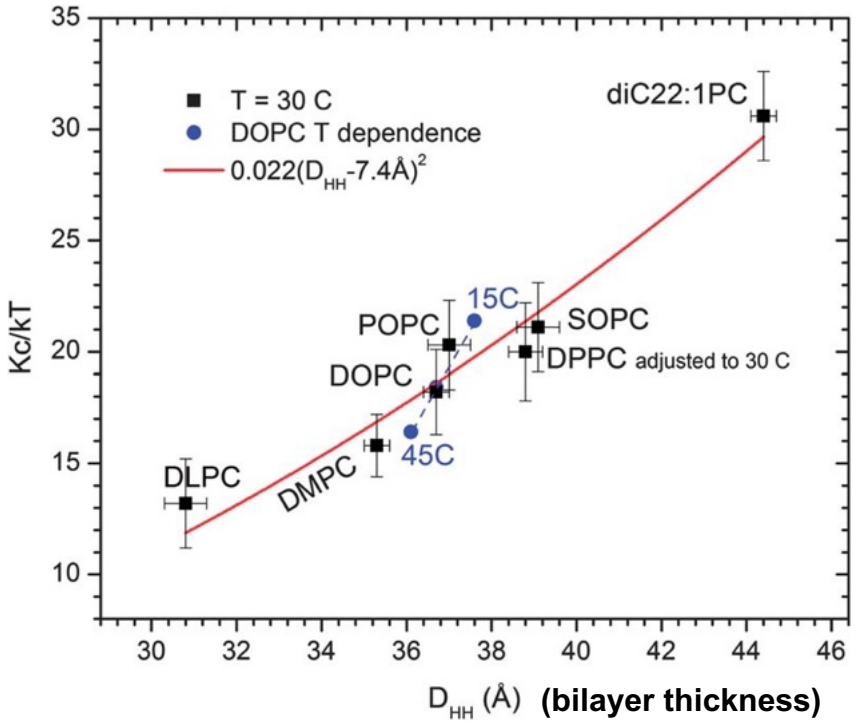
SPHERE  $C = \frac{2}{R}$

$$F = \frac{1}{2}\oiint \kappa \left(\frac{2}{R}\right)^2 dS = \frac{1}{2}\kappa \frac{4}{R^2} 4\pi R^2 = 8\pi\kappa$$

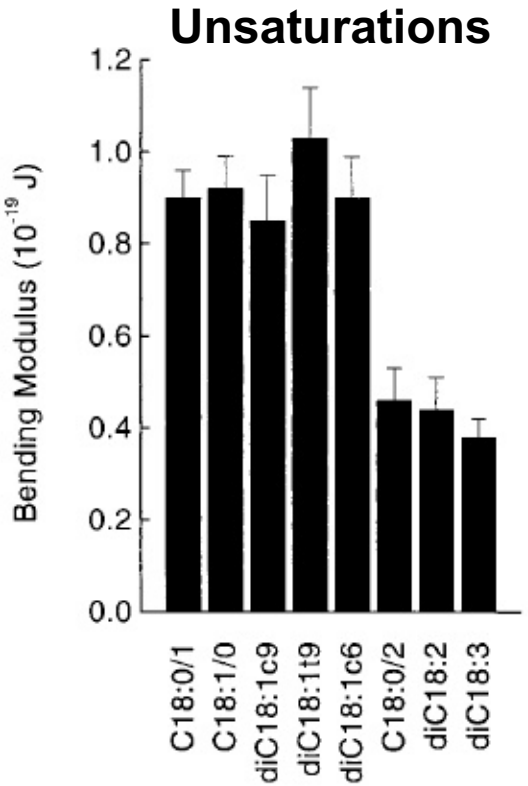
Independent of vesicle size!!!!

For κ=10 $k_B T$ $\quad$ $F \approx 250\ k_B T$

Effect of Chain Length and Unsaturation Numbers on κ



J. F. Nagle *Faraday Discuss.* **161**, 11 (2013)



W. Rawicz …E. Evans *Biophys. J.* **79**, 328-339 (2000)

κ

Increases with chain length
Decreases with unsaturation #
Increases with cholesterol
Sphingolipids

C. A. Day *et al.*, *Traffic* (2015)

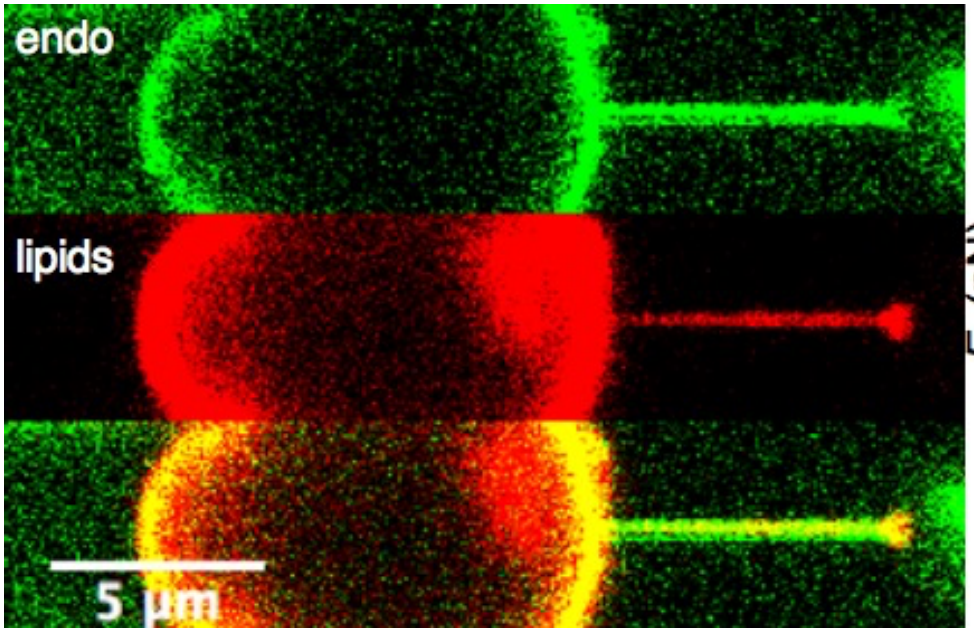
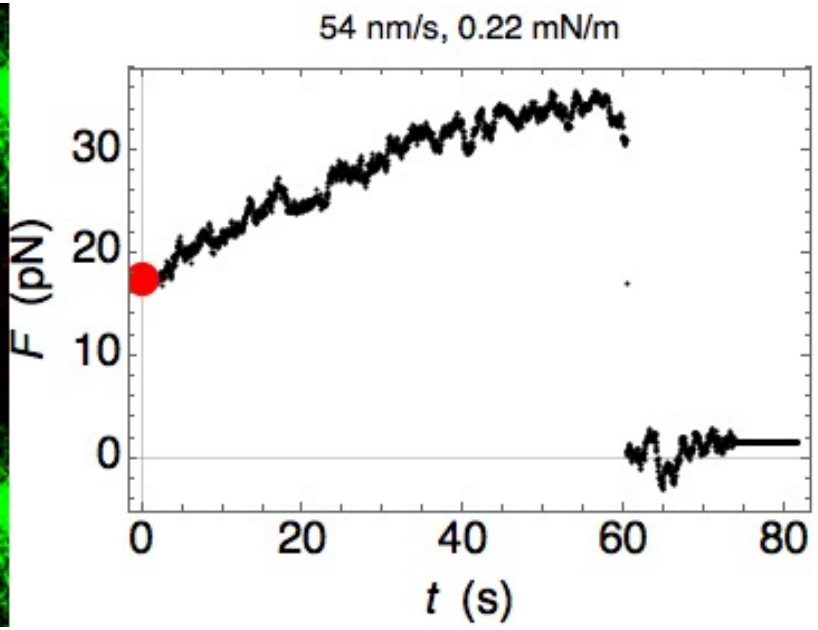
→ Pulling on endophilin-coated tubes *in vitro*

Dynamic Scission of EndoA2-Scaffolded Tube

Elongating a tubule coated with EndoA2



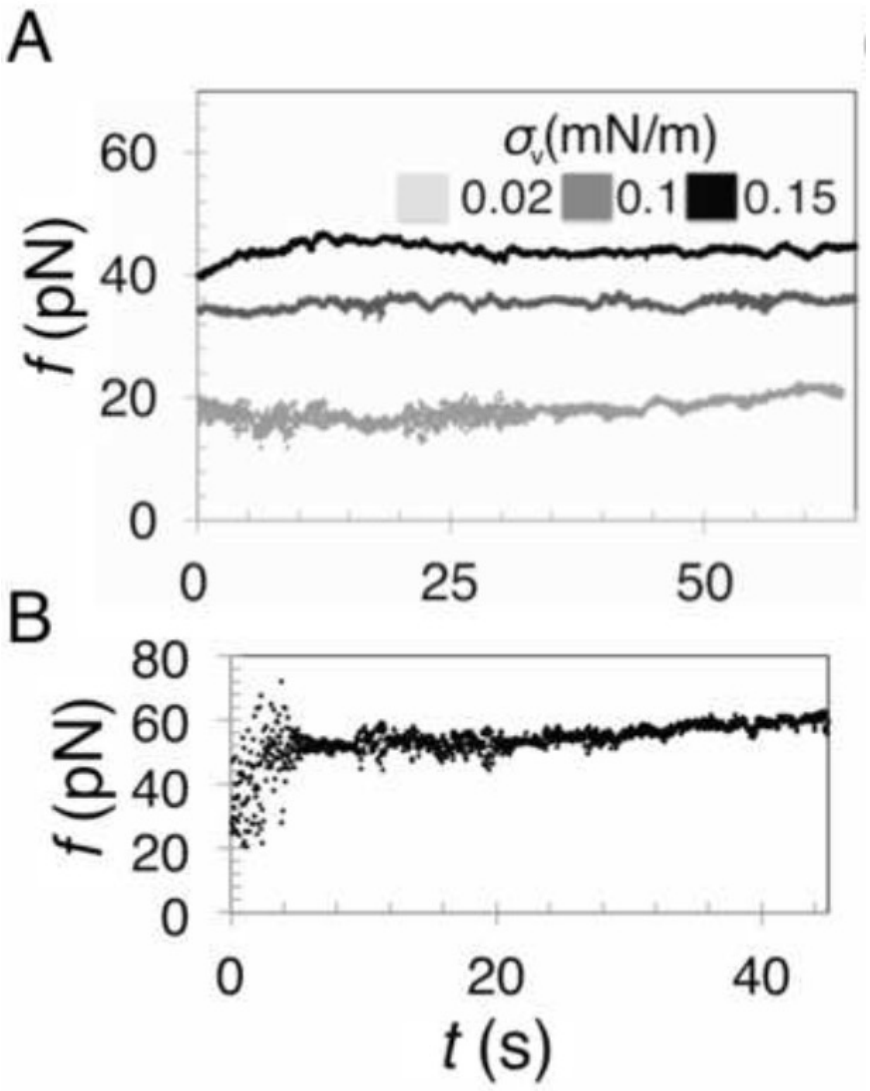


Scission if V> 20-30 nm/s

H.-F. Renard, M. Simunovic, J. Lemière *et al.*, *Nature* (2015)
M. Simunovic et al, *Cell* (2017)

Pulling on a Bare Tube

V=300 nm/s



V=1500 nm/s

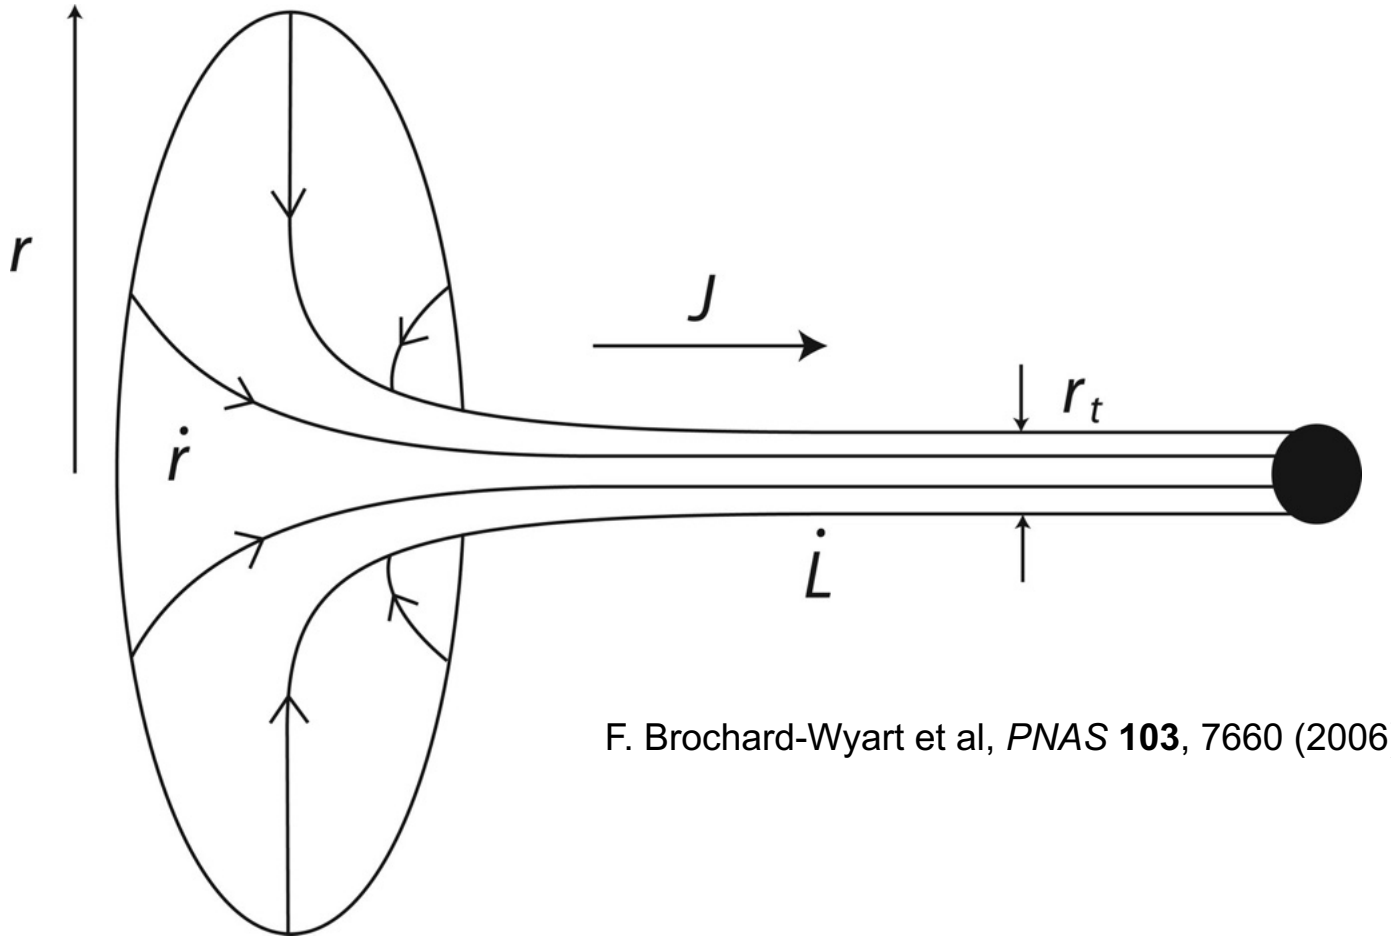
σ =0.08 mN/m

Stable tube

No scission

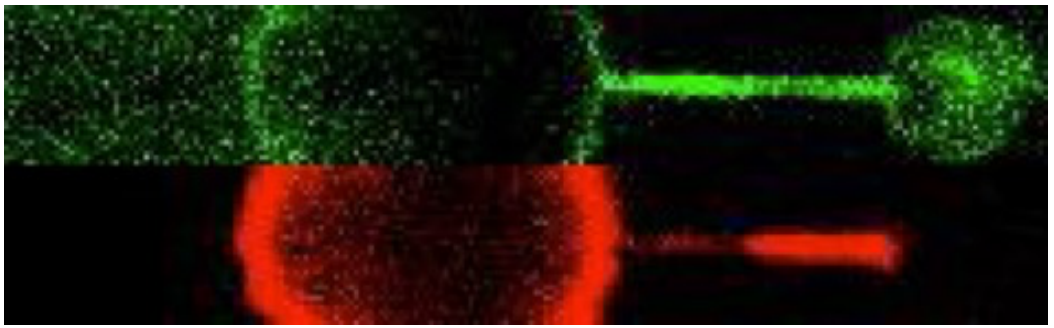
M. Simunovic et al, *Cell* (2017)

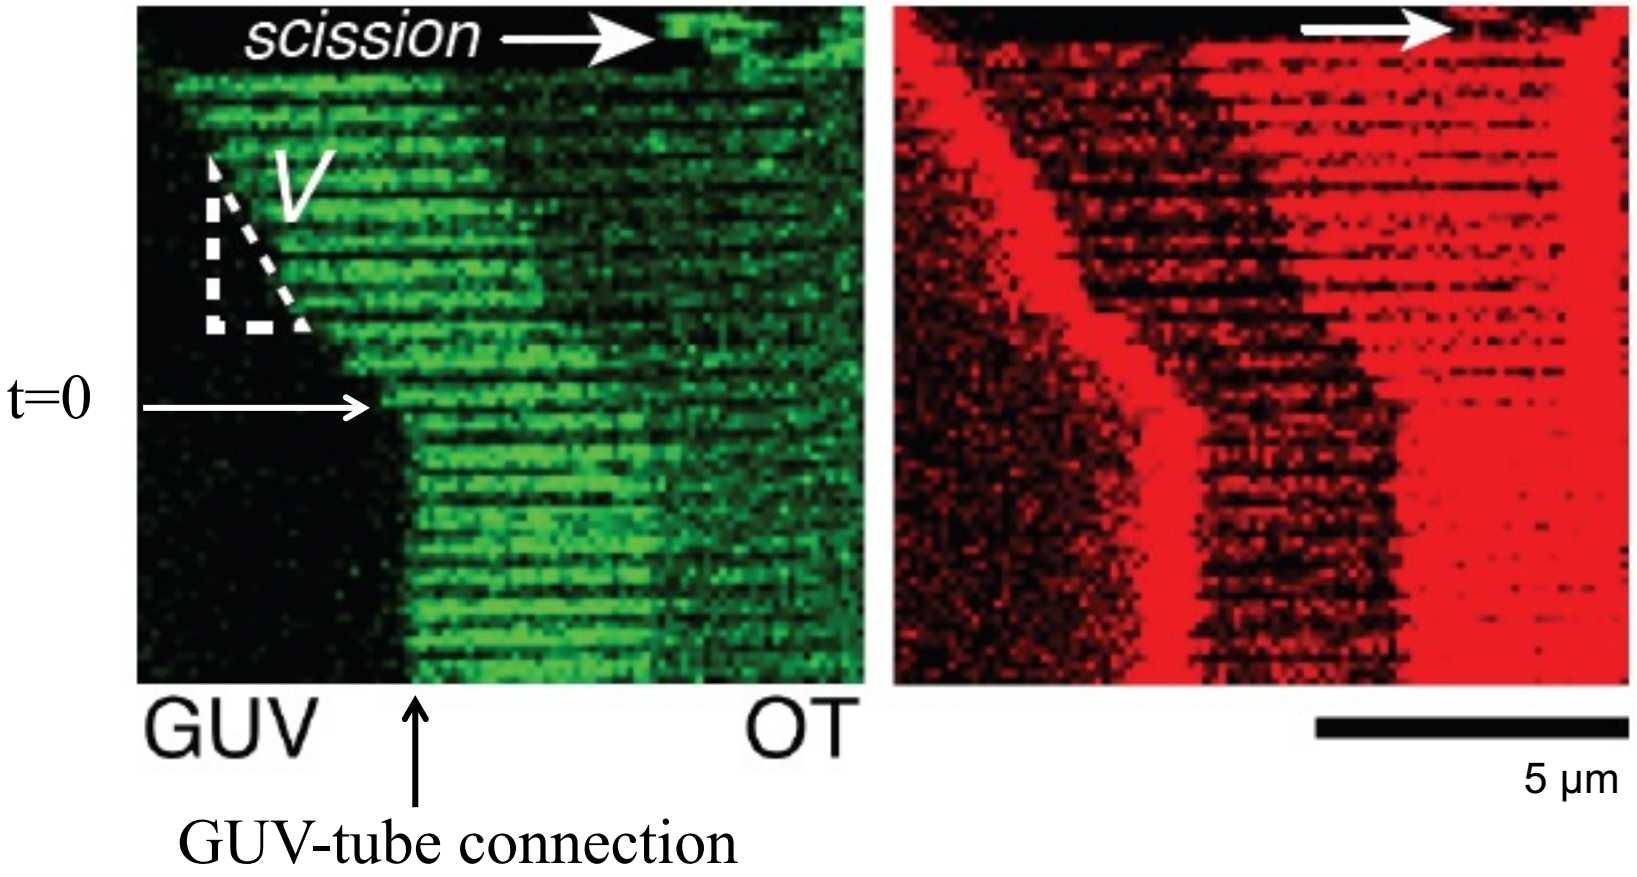
Flow of Lipids upon Tube Elongation



F. Brochard-Wyart et al, *PNAS* **103**, 7660 (2006)

Often, only a *partial* scaffold on the tube





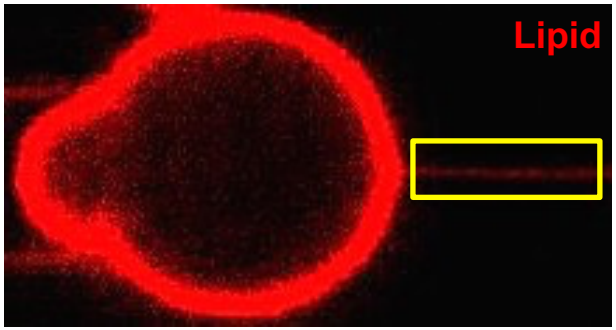
Important: scaffold remains *connected* to the GUV

M. Simunovic et al, *Cell* (2017)

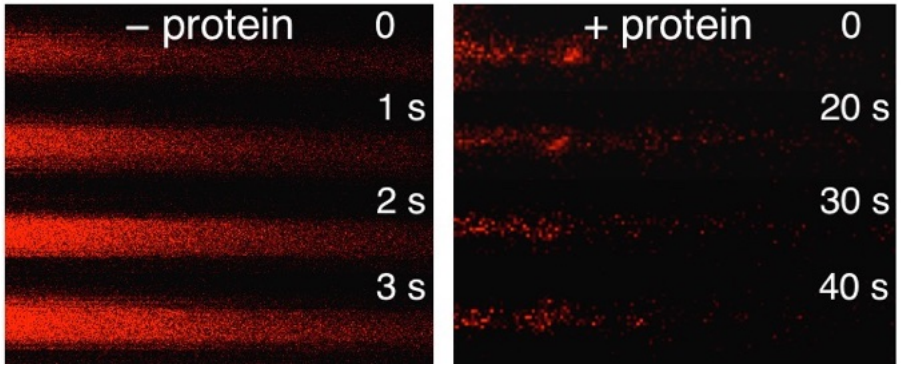
Endo A2 Scaffold: Barrier for Lipids

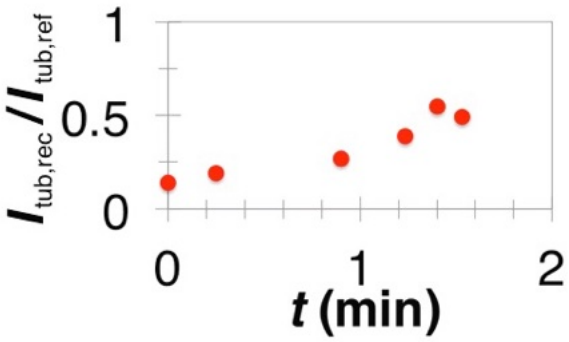
- *Diffusion blocked*

FRAP

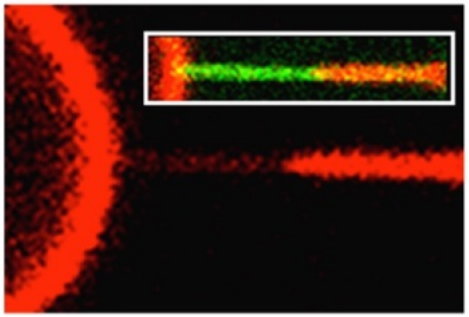


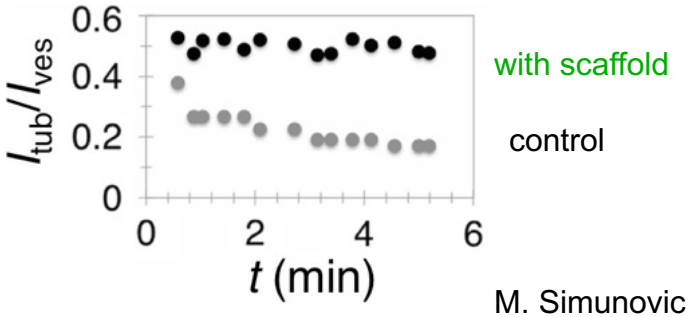
Fluorescence recovery



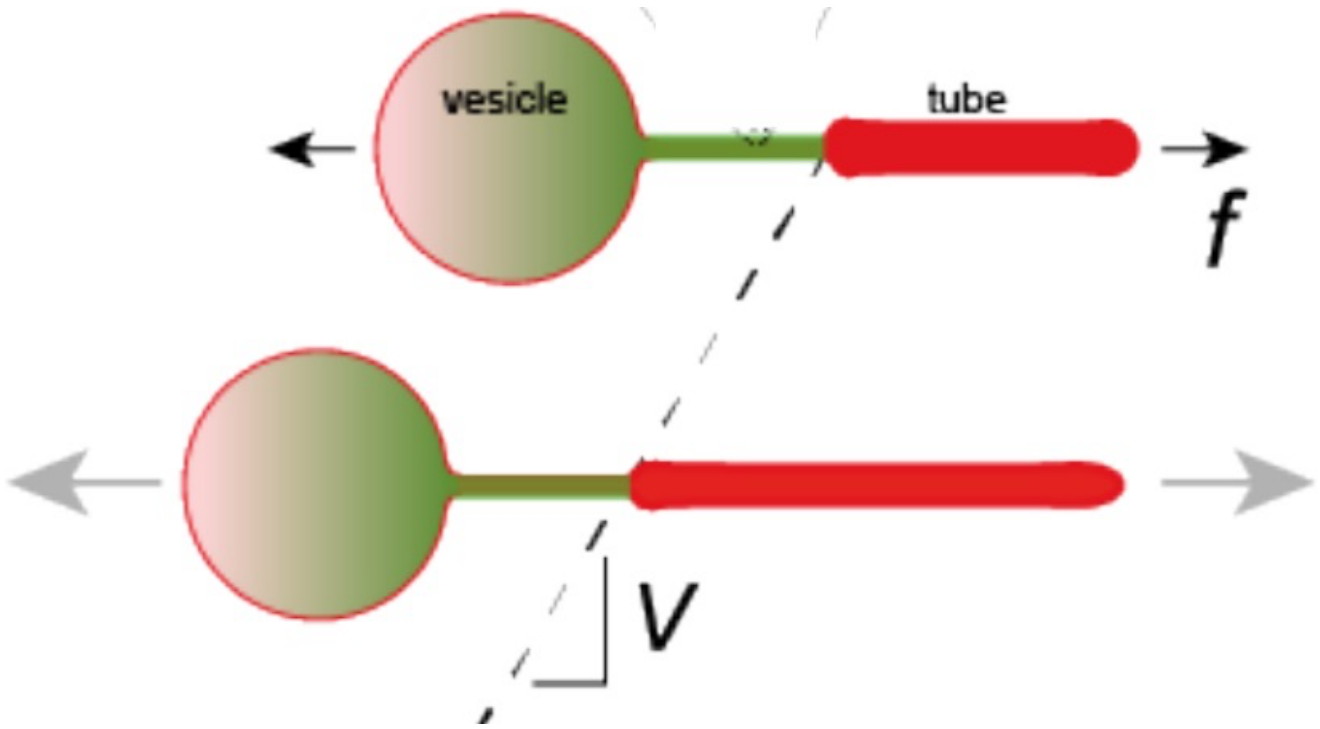


- *Tension* between GUV and tube *not equilibrated*





M. Simunovic et al, *Cell* (2017)



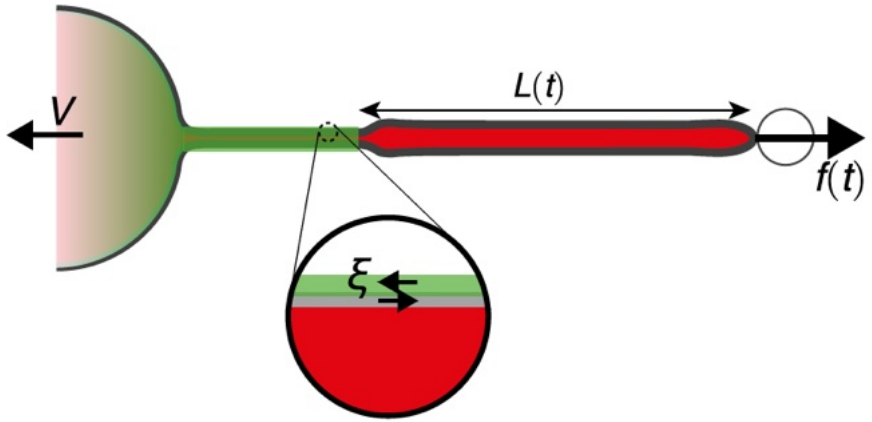
Endo A2 scaffold limits advection of new lipids in the tube

M. Simunovic et al, *Cell* (2017)

Friction-Driven Scission (FDS)

Theoretical model:
A. Callan-Jones
J. Prost

Friction ξ *between Endo scaffold and the membrane*



Creates *a difference of tension* between tube and GUV

$$\sigma(t) = \sigma_0 + \xi\, v_l$$

σ ↔ Force

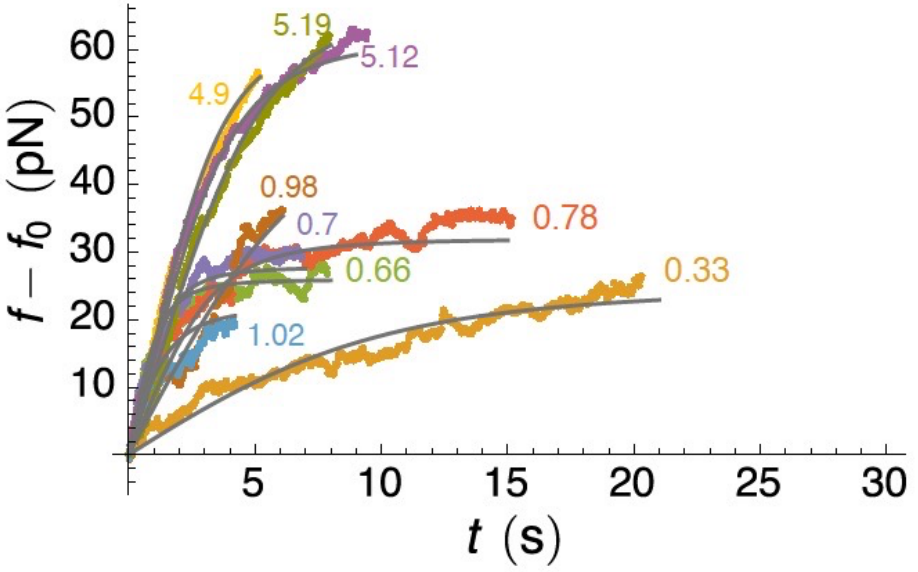
M. Simunovic et al, *Cell* (2017)

Friction-Driven Scission (FDS)

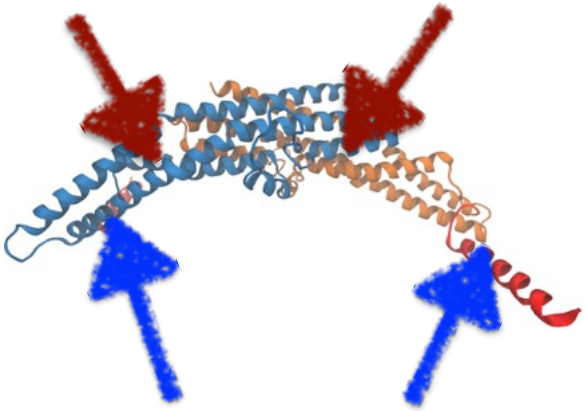
Theoretical model:
A. Callan-Jones
J. Prost

Force increase depends on *elongation speed*

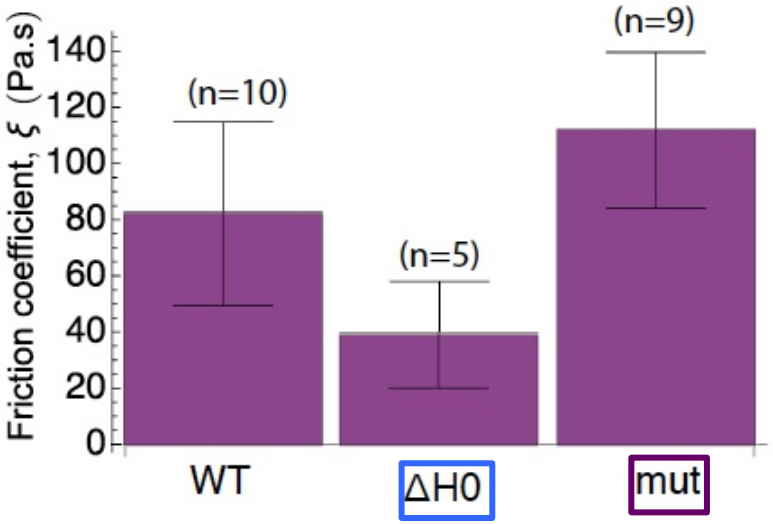
- Short time: *elastic*
- Long time: *viscous*



Mutations

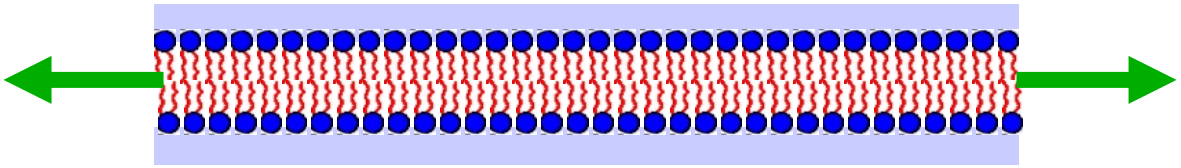


2 mutants : Endo ΔH0
mut (E37K, D41) (Stronger binder)

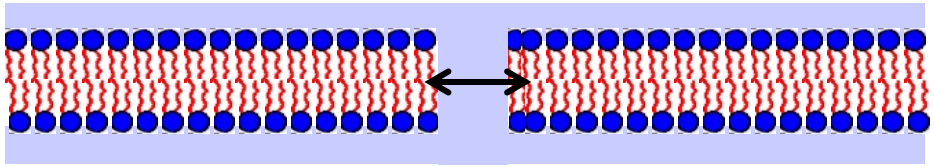


M. Simunovic et al, *Cell* (2017)

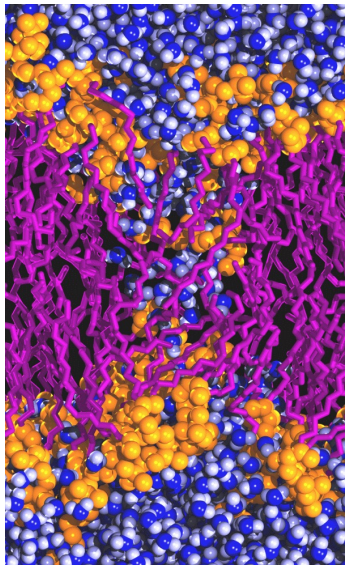
High Tension: Membrane Lysis



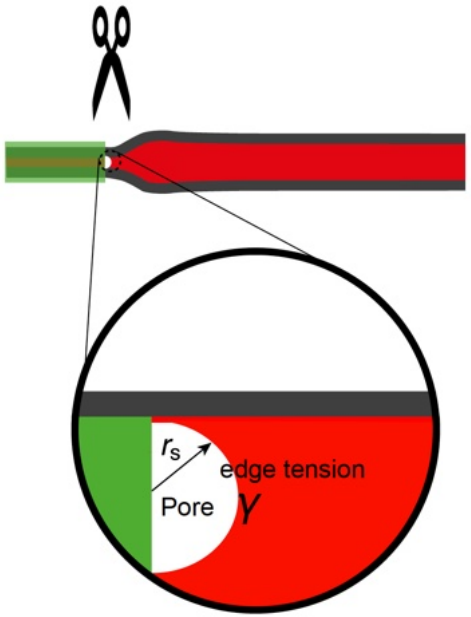
HOLE



Numerical simulations



Tension Increases up to Membrane Lysis



Pore nucleation

Rate-dependent pore nucleation at the edge

Cf. **E. Evans**, et al, *Biophys. J.* **85**, 2342 (2003)

$$W(t) \simeq \pi \gamma r_s - \pi r_s^2 \sigma(t)$$ Energy barrier

Kramer's theory
Pore nucleation probability

$$\nu(t) = \nu_0 \exp[-W(t)/(k_B T)]$$

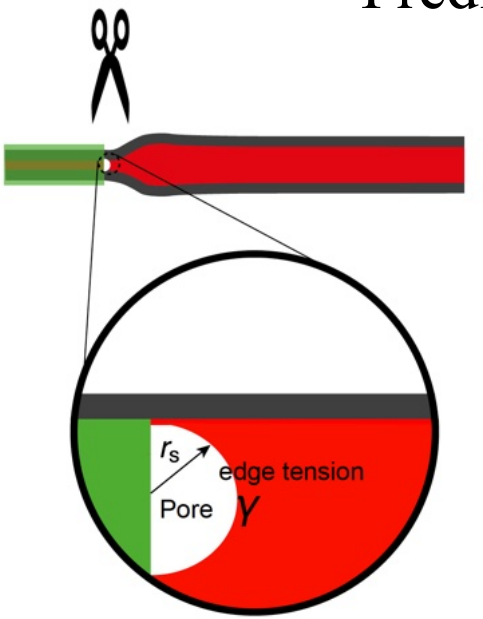
Prediction: $$f_{break} - f_0 \simeq (16\pi^3 \kappa^2 \xi / r_s)^{1/3} V^{1/3}$$

$$Ln(t_{break}) \propto V^{2/3}$$

M. Simunovic et al, *Cell* (2017)

Tension Increases up to Membrane Lysis

Prediction: $f_{break} \propto V^{1/3}$ at low pulling speed



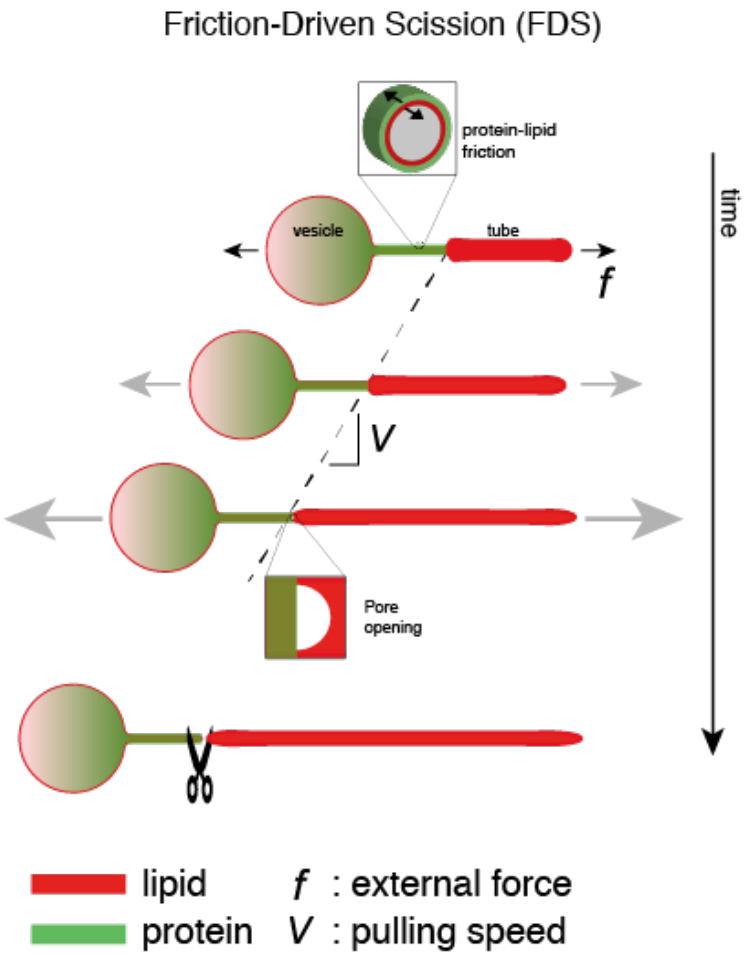
Pore nucleation

	ξ (Pa.s) - WT	ΔH0	mut
f increase	*80*± 30	*39*± 19	*112*± 27
f break	*30*± 12	*1.4*± 2	*66*± 6

M. Simunovic et al, *Cell* (2017)

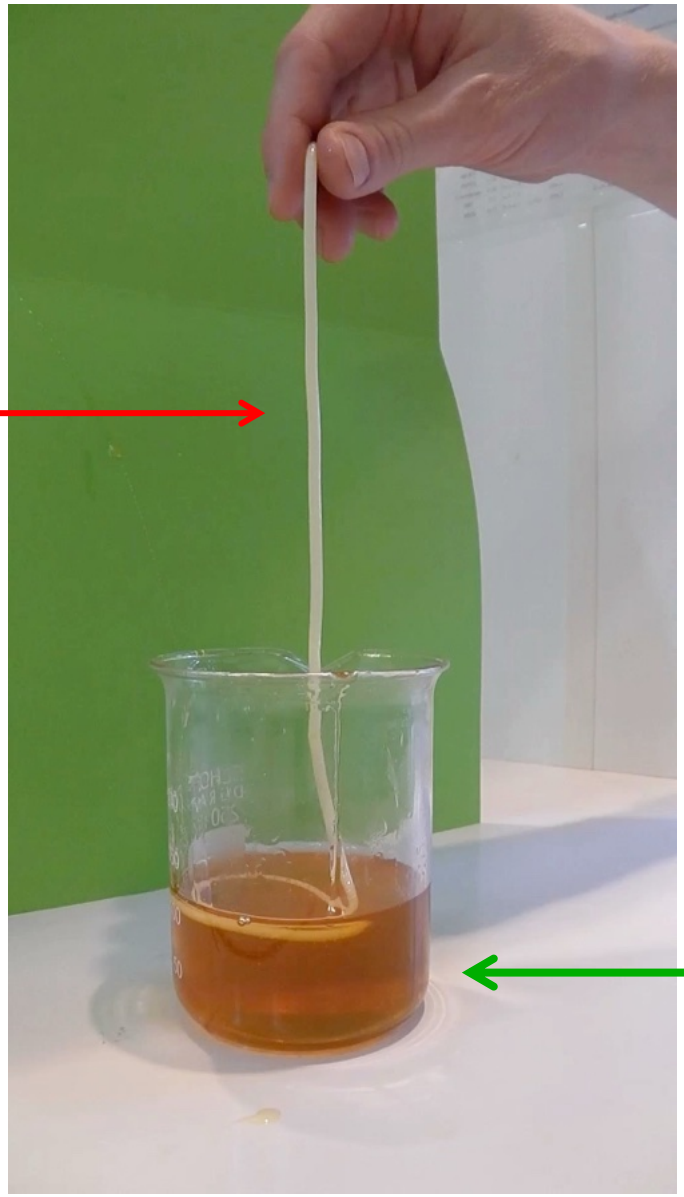
Conclusion

Friction pull coat/membrane + GUV-coat linked → Tension builds up (Force increases) → Pore Nucleation → Break



Mechanical Analogy

Elastic material (overcooked spaghetti)



Viscous medium (honey)

(Speed 1:6)

M. Simunovic et al, *Cell* (2017)
